

Eye Damage Due to Sunlight – Picture This

UV-A rays can:

- Damage the retina
- Affect your central vision
- Impair your ability to read, notice details, & recognize faces

UV-B rays can:

- Damage the cornea & lens
- Affect vision clarity
- Impair your ability to see vibrant colors

How Does UV Light Affect My Eyes?

Excessive UV exposure can increase your risk of eye issues.

Pterygium is a non-cancerous eye growth that can eventually impede vision.

It is **11 times more common*** in parts of the world experiencing higher UV intensity.

Cataracts occur when lens proteins create a cloudy mass, obscuring vision.

An estimated **20%* of cataracts** develop from too much UV radiation.

UV exposure contributes to macular degeneration; a condition resulting in vision loss for over

10 million Americans.*

When Do My Eyes Need Protection?

Snowy Weather
Snow can reflect up to **80%* of UV radiation.**

Sunny Weather
27%* of Americans reportedly never wear sunglasses.

Cloudy Weather
Damaging UV-B rays can be up to **40%* stronger** on cloudy days.

On the Water
Open water can reflect up to **13%*** of radiation.
