

# If You're Talking More Than They Are, You're Probably Not Training

Most safety managers and supervisors were taught that good training means being clear, thorough, and prepared. You plan the session. You know the hazards. You explain the rules. You answer questions. You make sure nothing important is missed.

So, you talk. A lot.

And from the outside, it looks like training is happening. The room is quiet. Heads are nodding. No one is challenging what you are saying. You get through the material on time.

The problem is that silence is not engagement, and talking is not teaching.

If the goal of safety training is behavior change, then who is doing most of the talking matters more than most trainers realize.

## Why One-Way Safety Training Feels Efficient but Rarely Works

Lecturing feels efficient because information moves in one direction. You control the message. You cover what needs to be covered. You reduce the risk of saying the wrong thing.

But safety is not a knowledge problem. It is a decision problem.

When workers are passive listeners, they are not practicing decision-making. They are not explaining how they see risk. They are not revealing where their understanding is strong or where it breaks down.

They are performing compliance.

In many safety meetings, workers learn exactly one thing. Keep your head down, agree, and get back to work.

That lesson is rarely intentional, but it is powerful.

## A Story Almost Every Supervisor Recognizes

A supervisor once described a weekly safety meeting that ran like clockwork. He reviewed incidents. He went over the topic of the week. He reminded the crew of

expectations. No one ever interrupted him.

When a near miss occurred weeks later, he was genuinely surprised. In the investigation, one worker admitted that they had noticed the risk days earlier but did not think it was worth bringing up. "You already covered that," they said. "I figured you had it handled."

The supervisor had been talking. The crew had been listening. No one had been thinking together.

## **Talking Feels like Leadership, Listening Feels Risky**

Many supervisors worry that if they stop talking, they will lose control of the message. Someone might say something incorrect. The conversation might drift. Time might run out.

Those fears are understandable. But they come with a cost.

When trainers do most of the talking, they never hear how work is done. They never hear which rules feel unrealistic. They never hear where people hesitate or improvise.

The training becomes polished but disconnected.

Listening feels risky because it surfaces reality. Reality is often messier than policy.

## **What Great Safety Trainers Understand About Silence**

Skilled trainers are comfortable with silence. They ask a question and wait. They let the room sit quietly long enough for someone to think, not just react.

That pause matters.

It signals that the answer is not obvious. It invites reflection. It gives permission for uncertainty.

When someone finally speaks, the conversation changes. Others join in. Stories emerge. Real situations surface.

That is where learning happens.

## **Why Workers Talking Improves Safety Outcomes**

When workers explain how they make decisions, they reveal patterns trainers cannot see otherwise.

You hear where shortcuts are common. You hear which hazards are underestimated. You hear which rules are followed only when conditions are perfect.

This information is gold.

It allows training to address real risk rather than imagined risk. It also makes workers part of the solution rather than recipients of instruction.

People are far more likely to change behavior they helped examine than behavior that was simply dictated.

# **A Different Kind of Safety Meeting**

In one operation, a safety manager decided to experiment. Instead of opening the meeting with a topic, they opened with a question. "What made work harder than usual this week?"

At first, the room was quiet. Then someone mentioned a piece of equipment that had been unreliable. Another mentioned staffing pressure. A third mentioned rushing through setup.

The safety topic emerged naturally. It was not on the agenda, but it was exactly what needed to be discussed.

That meeting ran longer than usual. But incidents declined in the weeks that followed.

The difference was not better content. It was shared thinking.

## **Asking Better Questions Instead of Giving Better Speeches**

Great safety trainers rely less on explanation and more on questions.

Instead of saying, "Here is the rule," they ask, "When does this task start to feel risky?"

Instead of saying, "You need to follow the procedure," they ask, "What usually makes people skip this step?"

These questions invite honesty rather than compliance.

They also expose where training needs to go next. If everyone answers differently, clarity is needed. If everyone answers the same way, alignment already exists.

Talking less allows trainers to target more precisely.

## **The Myth that People Already Know What to Say**

Some trainers assume that if workers had something to contribute, they would speak up. Silence is interpreted as agreement.

In reality, silence often means people are unsure whether their perspective is welcome.

Workers are constantly reading cues. Does this supervisor interrupt? Do they correct people publicly? Do they react defensively?

If past experiences taught them that speaking up leads to discomfort, silence becomes the safest option.

When trainers intentionally create space for dialogue, that pattern can change surprisingly fast.

## **Training Becomes More Efficient when Workers Talk**

There is a belief that discussion-based training takes too long. In practice, the opposite is often true.

When workers talk, trainers spend less time covering irrelevant material. They focus on what actually matters. Repeat incidents decline because root causes are addressed

early.

Instead of retraining everyone on everything, training becomes targeted and responsive.

The time saved later often far exceeds the time spent listening now.

## **How This Changes the Trainer's Role**

When workers talk more, the trainer's role shifts.

You are no longer the primary source of answers. You become a facilitator of insight. A guide. A coach.

This does not reduce authority. It increases credibility.

Workers trust trainers who understand their reality. They listen to people who listen to them first.

That trust is what allows correction to land when it is necessary.

## **What this Looks Like During Inspections and Observations**

The same principle applies outside the classroom.

During inspections, trainers who talk constantly miss information. Those who ask and listen learn quickly.

Asking, "What do you watch for here?" reveals far more than pointing out what is wrong.

The conversation becomes collaborative instead of corrective. Risk surfaces earlier. Defensiveness drops.

## **A Quieter Room, A Louder Culture**

Training sessions where workers talk more often feel messier. They are less scripted. They involve disagreement and uncertainty.

That messiness is a sign of learning, not failure.

Over time, these conversations spill into daily work. People ask more questions. They challenge assumptions. They speak up sooner.

The room may be quieter during the lecture, but the culture is louder where it counts.

## **The Hardest Habit to Break**

For many safety managers and supervisors, talking feels productive. Listening feels passive.

In reality, listening is one of the most active things a trainer can do. It requires attention, restraint, and curiosity.

Breaking the habit of filling silence takes practice. It feels uncomfortable at first. But the payoff is immediate.

You learn more. Workers engage more. Training becomes real.

# Closing Thoughts

If safety training is about changing how people think and act when no one is watching, then it cannot be a one-way broadcast.

When trainers talk less, workers think more. When workers think more, they make better decisions.

The measure of a great safety training session is not how much was said. It is how much was understood, shared, and carried forward.

If you leave a session knowing exactly what everyone thinks about the risk, you trained well.

If you leave knowing only what you said, you probably did not.
