

Preventing Back Injuries Stats and Facts

FACTS

1. Exerting too much force on your back – such as by lifting or moving heavy objects – can cause injury.
2. Repeating certain movements, especially those that involve twisting or rotating your spine, can injure your back.
3. An inactive job or a desk job can contribute to back pain, especially if you have poor posture or sit all day in a chair with inadequate back support.
4. Aging, obesity and poor physical condition can also contribute to back pain
5. Back pain can range in intensity from a dull, constant ache to a sudden, sharp or shooting pain. It can begin suddenly as a result of an accident or by lifting something heavy, or it can develop over time as we age.
6. Pain in the upper back is usually the result of poor posture, muscle overuse, or injury.
7. Herniated discs are more common in the lower back but may sometimes happen in the upper back too.

A herniated disc can slip far enough out that it compresses the nearby nerve. A pinched nerve in the middle back may cause:

- numbness and pain in the arms or legs
- problems with controlling urination
- weakness or loss of control in the legs

STATS

- According to the Bureau of Labor Statistics, more than one million workers suffer back injuries each year, and back injuries account for one of every five workplace injuries or illnesses.
- More than one million back injuries are sustained in the workplace annually.
