## Sun Protection - No Skin Off Your Nose Infographic

## **Top 5 Sun Protection Mistakes** (Plus, How to Avoid Them!)

We talked with OhioHealth surgical oncologist Natalie Jones, MD, to find out where we're making mistakes with sun protection, what long-term effects can result from excessive sun exposure, and how to get back on the right track.

Mistake: Paying too much for sunscreen & not using it often enough

SPFs with higher price tags don't always equal more coverage.

If it's more affordable, you're more likely to use it properly.

Generously apply SPF 15 to 30 sunscreen every 2-3 hours.

Mistake: Underestimating the strength of the sun

Tip#1 The sun is at its strongest between 10 a.m. and 4 p.m.

Don't misjudge the strength of the sun on an overcast day. Most of the sun's harmful rays punch right through the clouds.

Mistake: Choosing the wrong clothing

Carry a wide-brimmed hat to cover your face and neck.

Swim shirts with UVA/UVB protection are great options for kids

Mistake: Underestimating

Preventing sunburns is ideal, but being mindful of daily sun exposure is important, too.

A few blistering sunburns increases your risk of developing the three main types of skin cancer.

Mistake: Not having a baseline medical examination of your skin

It's important to have a yearly skin exam (especially if you have moles or a fair complexion).

The sooner skin cancer is diagnosed, the better the opportunity for a successful outcome.
