Time Management: Managing Multiple Tasks Safely Picture This

The image shows a busy warehouse where several employees are working at the same time in a rushed and disorganized environment. One worker is carrying multiple boxes while looking at a clipboard and using a headset, walking near a moving forklift. In the background, another worker is reaching from a ladder to handle boxes on a high shelf, while other materials and packages are scattered around the work area.

What’s wrong is that workers are multitasking instead of focusing on one task safely. The main worker has limited visibility, is distracted by the clipboard and headset, and is walking near a forklift while stepping close to a spill and a loose cord. The walkway is cluttered, the forklift is operating too close to pedestrians, and the

worker on the ladder is overreaching. These unsafe actions show poor time management, rushing, and lack of attention to hazards, which can lead to slips, trips, falls, struck-by incidents, or serious injuries.
