

Warm-Up and Stretch Breaks – School Safety Picture This

The image shows a student who appears to have injured their foot or ankle, likely during a physical activity such as running or sports. The absence of one shoe and the act of holding the foot suggest a possible strain, sprain, or muscle cramp, which are common in schools when students engage in physical activity without proper warm-up or stretching. Without preparing the body, muscles and joints are more susceptible to sudden injuries.

To prevent such injuries, schools should incorporate structured warm-up and stretching routines before any physical activity, including PE classes and sports events. These routines should focus on gradually increasing heart rate and improving flexibility, especially in the legs, back, and arms. Regular stretch breaks during long sitting periods in classrooms can also reduce fatigue and improve concentration. Educators should teach students the importance of warm-ups and monitor proper techniques to foster a culture of safety and injury prevention in all school environments.
